

TRANSMISSION RELOCATION

SOUTHWEST CALGARY RING ROAD (SWCRR) 138 KV

PROJECT OVERVIEW

At the request of Alberta Transportation and to accommodate the Southwest Calgary Ring Road (SWCRR) project, ENMAX Power is constructing a new 138 kV transmission line in Southwest Calgary that will replace existing transmission infrastructure. The new transmission infrastructure will be installed in the power line component on the west boundary of the newly established Transportation Utility Corridor (TUC). The TUC is located on land that was transferred from the Tsuu T'ina Nation to the Government of Alberta to accommodate a portion of the SWCRR project. The existing 138 kV transmission infrastructure which is in conflict with the future location of the SWCRR will be removed.

PROJECT DETAILS

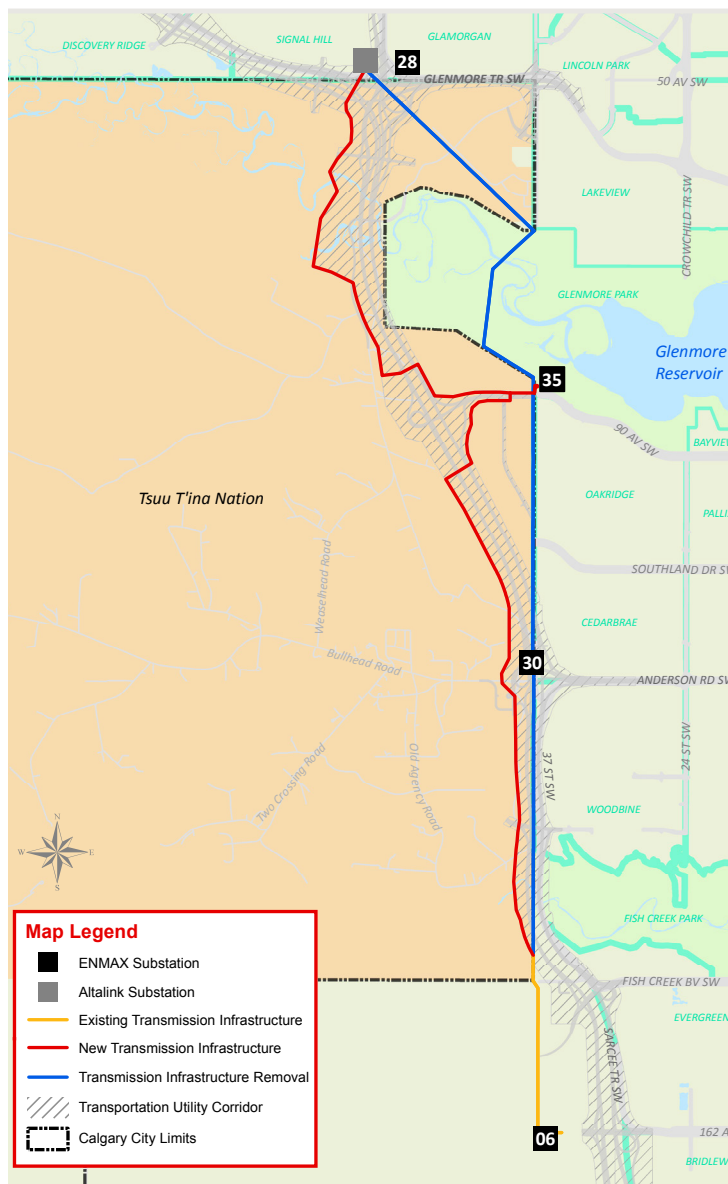

Construction on relocating the 138 kV transmission line will begin south of the Glenmore Trail and Sarcee Trail intersection and continue south via ENMAX No. 35 Substation which is located north of 90 Avenue SW in the southwest corner of North Glenmore Park and continue to ENMAX No. 6 Substation located at 16300 – 37 Street SW.

The transmission line is approximately 14 kilometres in length and will have steel monopole structures.

Starting in November 2016, temporary construction access roads will be built and materials will be delivered to site. Crews will begin assembling and installing transmission structures in January 2017. All construction will take place between the hours of 7 a.m. and 5 p.m.

The anticipated completion date of the new transmission line is September 2017. The existing 138 kV transmission line and ENMAX No. 30 Substation will be salvaged and removed once ENMAX No. 35 Substation and the new transmission lines are energized.
